

Good day,

REFLECTION & DOCUMENTATION

My journey throughout this competition, it was not a tough competition to others but then to me it felt like something that wants me to apply what I know and also apply the skill that I have. The difficulties I faced on the first day of the competition is that it wasn't allowing me to submit (what I did is that I had to redo the work which required the skills on how you can help with the world problem/ skills that can be implemented to help with the world problem) Another issue I faced on same day is that it only allowed me to log in using one device (but then these problems they were not actually that big) so the only solution I had on the file that didn't want to share was to repeat my work again.

On the second day (it was for the website) here I actually messed up a lot when I was starting (it was because I was tired and I just wanted to sleep) so the app that I was using it was visual studio code then file then HTML (here comes the problem) it didn't want to display the pictures I also had to redo my coding again but then on the pictures I had to go to the codes to be able to get links for the pictures (after when it was done generating the links that's when it was displaying the pictures) so on the colors I had to use they were from CSS but then those colors they were a bit okay (they are not my favorite colors though) anyway when I was submitting I didn't face any problem.(I thought maybe when I submit it wont display any pictures because from my side they were not displaying when I was done so the issue that I thought I had it was the picture problem)

So, on the third day (it wanted us to give out the best programming languages) here I never faced any trouble (all I had to do was typing till I'm tired).

First day I used docx then converted it to a pdf

second day I used Visual Studio code, CSS for styling, front end developer for designing (also looked for some templates in Figma), web design to assist front end, also markup for a perfect structure, tags or a format

third day I used docx then converted it to pdf

So, the lesson that I learnt is that I should not give up I should also find ways to finish up my work even if I badly want to do something else. Also, I should try something else if its not displaying or recode again until it works. One thing I noticed is that most of the time we should unlock ourselves into using 4 cornerstones (Abstraction, Pattern recognition, Decomposition, and also algorithm).
